### Background

Why reinvent the wheel when you can learn from the mistakes by others before you? Data Governance programs can achieve a faster time to value by adopting best practices from a people, process and technology perspective.

The Data Governance Industry Models Software Templates for Insurance combine the following into one solution:

- People and Process best practices from hundreds of data governance projects.
- Industry patterns for data governance in insurance.
- Market leading data governance software from Collibra.

### Pre-requisites

- Collibra Data Governance Center 4.1
- Two-day training session

## Data Governance Center

One integrated product suite to make data governance practical: implement your data governance operating model, increase and sustain end user adoption and report on compliance, maturity and ROI metrics.

One of the single biggest challenges in Data Governance is sustained adoption. The Collibra Data Governance center drives end user adoption through easy business friendly end user interfaces, extensive data publication and consumption possibilities and integration with productivity tools and mobile devices (email approvals, I Pad app, portal integration, Search everywhere,...). Accessible data assets become true Enterprise data assets.

As soon as you start your first Data Governance activities within the Collibra Data Governance Center, you can start collecting metrics, which cover data- as well as steward and stakeholder activity metrics. Examples include growth metrics that show progress (e.g., declining trend in the number of issues month by month) or maturity metrics that indicate your current level (e.g., 50% responsibility coverage for your assets or 75%). Thus providing key metrics to the organization, as well to upper management regarding the value and ROI of the data Governance program.
